Living Shorelines

FOR THE CHESAPEAKE BAY WATERSHED

CHESAPEAKE BAY FOUNDATION
Saving a National Treasure
Living Shorelines are a creative and proven approach to protecting tidal shorelines from erosion. The technique consists of planting native wetland plants and grasses, shrubs, and trees at various points along the tidal water line. Plantings are often coordinated with carefully placed bioengineering materials, such as man-made coconut-fiber rolls (or biologs) to protect vegetation and soils. Where viable, oysters can be included as well. Projects may include stone elements, as long as they do not cut off access to the shore.

Living shorelines have many benefits and vary with specific site conditions. They:

- improve water quality by settling sediments and filtering pollution;
- provide shoreline access to wildlife, such as nesting turtles, horseshoe crabs, and shorebirds;
- provide shallow water habitat and a diversity of plant species for aquatic and terrestrial animals;

---

**DO YOU HAVE A FAILING BULKHEAD OR EROSION BEHIND A ROCK WALL?**

Think about a living shoreline before you replace these structures with similar ones.

Substantial erosion is occurring behind a failing wooden bulkhead, and traditional turfgrass lawns do little to hold soil in place.
provide shade to keep water temperatures cool, helping to increase oxygen levels for fish and other aquatic species;
look natural rather than man-made and artificial;
absorb wave energy so that reflected waves do not scour the shallow sub-tidal zone and hamper the growth of underwater grasses; and
are often less costly than wooden bulkheads and rock walls (also known as “revetments”).

**Erosion: A natural process**

Shorelines are continually eroded by the movement of water, waves, and wind. Deposition of sediments and sand along shorelines further downstream helps sustain natural habitats. Human activities like high-speed boating and hardened shorelines on adjacent properties can greatly increase the rates of erosion. Installing living shorelines is a way to work with natural processes while still protecting shorelines.

In some instances, such as on steep slopes, regrading of the shoreline’s bank may be necessary to provide a stable slope and allow newly-planted vegetation to become established. Fill material can also be extended out from the existing shoreline and then planted with appropriate vegetation to create a tidal wetland marsh. In mid-to-high wave energy areas, an offshore breakwater may be installed to diminish wave energy.
**IS “ARMORING” YOUR SHORELINE ALONG TIDAL CREEKS REALLY NECESSARY?**

Many waterfront property owners who live on protected creeks and rivers see their neighbors’ wooden bulkheads and rock walls and think that they are the only solution to erosion concerns. However, where there is low-to-moderate wave energy and minimal erosion, it is usually not necessary to install these hard structures. Not only are they more costly, but they can destroy shallow water habitats when wave energy is reflected back.

A contrast in shorelines: The living shoreline on the left provides many water quality and wildlife benefits while blending in with the natural environment. The shoreline on the right is completely covered in stone and has no vegetation behind it to prevent erosion.

**THE “IDEAL” LIVING SHORELINE**

- **Trees and Shrubs: Above High Tide**
  - **BRACKISH WATER**
    - Eastern Red Cedar
    - Red Oak
    - Bayberry
    - Wax Myrtle
  - **FRESH WATER**
    - Black gum
    - Serviceberry
    - Red Maple
    - Sycamore

- **Tidal Wetlands: At High Tide**
  - **BRACKISH WATER**
    - High Tide Bush
    - Groundsel Tree
    - Marsh Hibiscus
    - Switchgrass
  - **FRESH WATER**
    - Buttonbush
    - Sweet Pepperbush
    - Winterberry
    - Swamp Rose

- **Tidal Wetlands: Mid to High Tide**
  - **BRACKISH WATER**
    - Saltmarsh Bulrush
    - Salt Meadow Hay
  - **FRESH WATER**
    - Arrow Arum
    - Blue Flag
    - Cardinal Flower
    - Marsh Hibiscus
The “Ideal” Living Shoreline

The “ideal” living shoreline in many tidal areas in the Bay watershed contains a succession of natural filters that normally would be found in undisturbed ecosystems. These filters include:

- riparian buffers above the tide line, made up of native trees and shrubs, including a mix of shrubs at high tide elevation;
- tidal wetlands, including grasses, rushes, and sedges at mid-tide elevation, and marsh grasses and common threesquare at low tide;
- oysters and an oyster reef—where appropriate; and
- underwater grasses in shallow water.

Selecting Native Plants

Native trees, shrubs, and grasses have expansive roots that hold soil in place and slow erosion from water and overland runoff. They add critical wildlife habitat and diversity, as well as beauty and value, to your property. Plant selection will depend on your site conditions.

If possible, purchase plants from a local nursery that propagates its own plants from regionally-obtained native stock or seed. (For a list of native plant nurseries, please refer to the chapter on selecting native plants.)
eries, contact your state’s native plant society or go to cbf.org/landscaping). If biologs are used as part of a living shoreline, herbaceous plants can be planted directly in the biologs. Over five to six years, the biolog will decompose naturally, but the plants’ roots will grow throughout the log to hold the bank or shoreline edge in place.

**When to Plant**

Perennials and grasses should be planted during peak growing season (in mid-to-late summer) to allow enough time for their root systems to become established before they go dormant in the late fall. Trees and shrubs should be planted in spring and fall when there is adequate rainfall to help them develop strong roots and leafy growth.

Showy native wetland plants, like Blue Flag iris (left) and Marsh Hibiscus (right), attract pollinators, provide seasonal color, and have extensive root systems to hold shorelines in place.

Volunteers plant hundreds of marsh grass plugs (Spartina alterniflora) at the Back Creek Nature Park waterfront.
Maintenance

Waterfowl, such as ducks and geese, love to feed on newly-planted vegetation. To keep them out of the area for the first full growing season, a three-to-four foot tall mesh enclosure—tied onto wooden stakes—should be erected. Large debris, such as logs, algae mats, and trash, should be periodically cleared from the site to protect wetland plants from smothering. For beach and water access, keep a narrow path to the water unplanted to avoid trampling vegetation. Control non-native invasive plants, such as English ivy and multi-flora rose, and replace them with native wetland plants and shrubs.

Expand Your Buffer

If your property is experiencing erosion, it is important to understand where it is coming from; not all erosion is due to waves, wind, and tides. On properties with steep slopes leading to the water, a major source of severe erosion can be runoff from rooftops, downspouts, and paved driveways unless adequate tree and shrub buffers are planted closer to the house.

By planting woody vegetation such as shrubs and smaller trees to create an understory, and large canopy trees as part of the buffer, you can greatly reduce runoff and soil loss coming from the land. The wider the buffer the better, but a width of at least 30 feet is ideal. If you are concerned about maintaining your view, plant larger trees away from sight lines and plant low-growing shrubs instead.
Three Types of Shoreline Projects

**NONSTRUCTURAL:**
Biologs and vegetation

**HYBRID:**
Segmented sills, jetties, or groins with natural beach shoreline and/or marsh plantings

**STRUCTURAL:**
Offshore breakwater (openings provide wildlife access)

Permit Process

Permit requirements for installation of living shorelines vary depending on state and local laws. No permits are required to plant vegetation on existing substrate on tidal or non-tidal shorelines unless fill is introduced or damaging equipment is required. However, permits are required for any alteration of shorelines in tidal areas, as well as wetlands. This includes:

- removal of vegetation;
- grading and introducing fill material;
- installation of nonstructural materials like biologs with toe boulders (narrow bands of rock that hold sand-fill and biologs in place); and
- installation of hard structures like bulkheads, sills, and revetments.

A joint federal/state permit application (JPA) from the U.S. Army Corps of Engineers is now in place to help streamline the process. Go to cbf.org/livingshorelines for appropriate links.

Getting Help: Demonstration Projects and Workshops

Many living shoreline projects have been successfully installed in the Chesapeake Bay watershed. For a list of publicly-accessible projects, go to cbf.org/livingshorelines.
Getting Help: Financial Assistance for Public and Private Living Shoreline Projects

Maryland has a wide range of loan, grant, and cost-share programs available for homeowners, communities, local governments, and non-profit organizations through state agencies and private foundations.

Virginia has grants available for private individuals through the Chesapeake Bay Trust’s Living Shorelines Initiative. The Chesapeake Bay Restoration Fund in Virginia only funds projects for public and non-profit organizations.

How to Make Your Living Shoreline Happen:

1. Identify your site conditions and determine suitable types of projects.

2. Contact your local and state agencies to get technical assistance and arrange a site visit.

3. Contact consultants and contractors who specialize in constructing living shorelines for a site visit, information, and financial estimates.

4. Plan ahead!
   - Permits take time (four months or longer depending on the type of work needed) so if you want construction to begin in the spring, you will need to start the permit process in the fall.
   - For grasses and herbaceous perennials, the best time to start construction is in the spring since plants are available from nurseries at the start of the peak summer growing season. (Trees and shrubs can also be ordered for a fall planting.)

5. Take photos before, during, and after your project.

6. Educate your neighbors and community about why you are constructing a living shoreline and what the benefits are to your local watershed and the Bay.

7. Enjoy your beautiful shoreline and the wildlife that you will attract!

   Go to cbf.org/livingshorelines for more information.

Living shorelines provide a natural setting for both humans and wildlife. They play an important role in restoring water quality in our rivers and streams, and ensure a future for fishing, crabbing, and boating on the Bay.
ABOUT THE COVER:
Shown one year after planting, this living shoreline project at St. John’s College, Annapolis, replaced 800 feet of wooden bulkhead with native plantings, tidal wetlands, oysters, and underwater grasses.
